

L 5018-66

ACC NR: AT5024888

to compare wind velocities along the route with the data gathered at Simferopol'. The plotted results indicate an even greater error in velocity prediction. An effort was made to determine whether observations at a station located at Ay-Petri would yield a better correlation with direction and velocity values. It was found that during the morning hours the Ay-Petri station gives more reliable wind characteristic readings. The author concludes that the Simferopol' aerological observations combined with the morning readings from Ay-Petri provide a better means of determining the flight conditions along the air route. Orig. art. has: 4 figures and 3 tables.

General and Physical Chemistry

Effect of pressure and temperature on viscosity of aqueous solutions of electrolytes and some waters (in petroleum deposits). V. I. Sergeevich, T. P. Zhurz, and A. I. Chestnov. *Izvest. Akad. Nauk S.S.R., Otdel. Tekh. Nauk* 1953, 890-904.—The following conclusions were obtained from the viscosity studies of aq. solns. of NaCl, KCl, and CaCl₂. Generally CaCl₂ and NaCl solns. have higher viscosities than those of KCl (results given graphically). The solns. of NaCl and CaCl₂ always show increase of viscosity with rise of external pressure at all concns. (cf. Cohen, *Ann. Physib. Chem.*, 45(1892)). Dil. in KCl solns. (0.501N) at 20° viscosity drops in the pressure interval of 1-160 atm., but at higher pressures (350 atm.) viscosity rises again to its value at atm. pressure. This anomaly disappears with increased concn., and at N concn. the drop of viscosity with pressure is not observed. In all cases viscosity drops with rise in temp. KCl and NaCl solns. show decreased effect of pressure on viscosity with increased temp.; in 0.501N KCl at 40° the effect is barely perceptible, and nonexistent at 60°. NaCl at 3N concn. shows a weak linear dependence of viscosity on pressure. G. M. Kosolapoff.

Vsesoyuznaya konferentsiya po treniiu i iznosu v mashinakh. 3d,
1958.

Iznos i iznosostorozhestvo. Antifrictionnye materialy (Bear and
Wear Resistance; Antifriction Materials). Moscow, Izd-vo AN
SSSR, 1956. 273 p. Errata slip inserted. 3,500 copies printed.
(Series: Itc: Trudy, v. 1)

Sponsoring Agency: Akademiya nauk SSSR. Institut mashinovedeniya.
Resp. Ed.: M. M. Khrushchov, Professor, Ed. or mashinovedeniya.
Author: M. Ya. Klebanov, and S. L. Orpik, Tech. Ed.;
T. V. Poljatova.

PURPOSE: This collection of articles is intended for practicing
engineers and research scientists.

CONTENTS: The collection published by the Institut mashinovedeniya,
AN SSSR (Institute of Machines, Academy of Sciences, USSR) contains papers presented at the III Vsesoyuznaya Kon-
ferentsiya po treniiu i iznosu v mashinakh (Third All-Union
Conference on Friction and Wear in Machines) which was held
April 9-15, 1958. Problems discussed were in 5 main areas:
1) Hydrodynamic Theory of Lubrication and Friction Bearings;
Chairman: Ye. N. Gut' Yar, Doctor of Technical Sciences and
and Lubricant Materials (Chairman: G. V. Vinogradov, Doctor of
Chemical Sciences); 2) Lubrication
E. P. Bergzin, Corresponding Member of the Academy of Sciences (Chairman:
N. N. Krushchov, Doctor of Technical Sciences);
3) Dry and Boundary Friction (Chairman:
I. V. Krugel'skiy, Doctor of Technical Sciences);
4) Bear and Wear Resistance (Chairman: N. M. Krushchov,
Doctor of Technical Sciences); and 5) Friction and Antifriction
Materials (Chairman: I. V. Krugel'skiy, Doctor of Technical
Sciences), and N. M. Krushchov, Doctor of Technical
Sciences). Chairman of the general assembly (on the first and
last day of the conference) was Academician A. A. Blagonravov.
L. Yu. Kuznetsov, Secretary. The transactions of the conference were
published in 3 volumes, of which the present volume is the
first. This volume contains articles concerning the wear and
wear resistance of antifriction materials. Among the topics
covered are: Modern developments in the theory and experi-
mental science of wear resistance of materials, specific data
on the wear resistance of various combinations of materials,
methods for increasing the wear resistance of certain materials,
the effects of friction and wear on the structure of materials,
the mechanics of the seizing of metals, the effects of various
types of lubricating materials on seizing, abrasive wear of a
wide variety of materials and components under many different
conditions, modern developments in antifriction materials, and
the effects of finish machining on wear resistance. Many per-
sonalities are mentioned in the text. References accompany some

AUTHOR: Chestnov, F.

TITLE: An automatic telephone exchange in space

PERIODICAL: Znaniye-sila, no. 7, 1961, 6-7

TEXT: The article reviews the prospects for a world-wide radio-telephone network based on personal ultra-short-wave pocket transceivers with extensive use of semiconductors and micro-bloc components. Each "subscriber" would have an assigned wavelength on which he could be called, tuning his transmitter wavelength to that of his correspondent's receiver. A call from a pocket transceiver would be picked up by the district stationary receiving center, channeled to a central exchange, boosted out and relayed out from a high antenna to the surrounding area or to a neighboring city exchange for further transmission. For relay over greater distances artificial earth satellites could be used. A satellite launched to a height of 35,800 km contrary to the earth's rotation and in the equatorial plane would be

Card 1/3

21761

S/004/61/000/007/001/003
D205/D306

An automatic telephone exchange in space

stationary in relation to the earthbound observer and would scan almost an entire hemisphere. Three such satellites, equally spaced on the same orbit, would give world-wide relay coverage. International calls, specially labeled by the pocket transmitter, would be singled out by the district receiving station, passed to the inter-city exchange and from there to the local relay station linked to one of the communications satellites. From the satellite the call would be relayed by the reverse system to its destination anywhere on earth. A further prospect is the individual videophone, a portable radio-television-telephone transceiver fed by tiny batteries using power emitted by radioactive materials. Models of such batteries already exist. Research is also being conducted into means of reducing broadcast bandwidth so as to fit more channels into the same frequency range. Instead of transmitting all the camera sees, television transmitters will be designed to send merely key instructions showing how the basic picture changes. The resulting loss in

Card 2/3

21761

S/004/61/000/007/001/003
D205/D306

An automatic telephone exchange in space

picture accuracy will be unnoticeable to the viewer. Information broadcast over radio and television can be extensively coded before transmission and then decoded cybernetically at the receiving end. Thanks to this the broadcast bandwidth could be greatly reduced. To prevent a transmission from "wandering" and impinging on other transmissions a high degree of transmitter frequency stability will be required. According to the non-Soviet technical press a generator with a stability of 1/1,000,000,000,000 on a frequency of 21 cm has been built. By developing the centimeter, millimeter and sub-millimeter bands new broadcast channels will be made available. Some of these frequencies are absorbed by the earth's atmosphere, which precludes their use for communication via satellite relay stations. Recent research has shown, however, that signals on certain cm, mm and sub-mm frequencies can successfully penetrate the atmospheric envelope and would, therefore, be suitable for communications purposes. There is 1 figure.

PURPOSE AND EVALUATION: A popular description of the ionosphere written in a simple and comprehensible style for a wide range of readers.

TEXT DATA

Coverage: This booklet, the 70th issue in the series "Scientific-Popular Library", deals with the problems of the ionosphere, its composition, and the phenomena occurring in the upper atmospheric layers, as well as with the modern methods of investigations. The author explains the origin of radio waves and the exploration of the ionosphere by means of short waves and radar. Radio weather forecasts, based on meteorological observations, are made in the USSR daily. This forecasting started in the Academy of Sciences,

1/3

Zagadka ionosfery

AID 661 - X

USSR, under the direction of M. V. Shuleykin. Radio specialists forecast also the changes in the earth's magnetic field, which cause disturbances in radio communications. The first permanent ionosphere station in the Soviet Union was built at Tomsk University in 1936 under the supervision of V. N. Kessenikh, radio physicist. The ionosphere is explored in the USSR also with rockets equipped with up-to-date instruments. The booklet is provided with illustrations and diagrams.

SOV/35-59-2-27/48

AUTHOR: Chestnov, F.

TITLE: "Stvor" (Stvor)

PERIODICAL: Nauka i zhizn', 1959, Nr 2, p 67 (USSR)

ABSTRACT: This article deals with a new Soviet radar device, called "Stvor", intended for river navigation and already used by fishing craft. The station is economical in consumption of electric energy - it requires only 1.5 kw and works within a range of 10-25 miles. The distance of any object from the ship is measured by five concentric circles arranged at equal intervals, which according to a scale, variable within the mentioned limits, fix each point on the screen. The course of the ship is indicated by a bright line starting from the centre. If necessary, it is easy

Card 1/2

"Stvor"

SOV/35-59-2-27/48

for the navigator to change the ship's course by simply measuring the angle of deviation.

TITLE: Method of calculation of the maximum permissible speeds of hydrofoils on inland waterways

SOURCE: Ref. zh. Vodnyy transport, Abs. 7V160

REF SOURCE: Tr. Tsentral. n.-i. in-ta ekon. i ekspluat. vodn. transp., vyp. 42, 1966, 26-44

TOPIC TAGS: hydrofoil, inland waterway transportation, ship navigation

ABSTRACT: The designing of fast ships heretofore has not included a theoretical demonstration of admissible speeds of movement and control of hydrofoil relative to the size of the navigable waterway. A method based on a detailed investigation of the visual method of fast ship maneuvering on curved sections of waterways, is proposed for the calculation of admissible speeds of movement on rivers. It is based on the proposition that the radius of circulation R_{circ} of fast ships increases considerably with increases in speed. The control and maneuverability of a fast ship are therefore

Card 1/2

UDC: 629.12, 629.122.69

ACC NR: AR7005050

factors which limit the speed of movement. This limitation is caused by the presence of curvilinear sections with limiting radius of curvature R_{curv} and the width of the navigation channel. Three cases are examined: $R_{circ} = R_{curv}$, $R_{circ} < R_{curv}$, and $R_{circ} > R_{curv}$. Standard working formulas to determine the maximum admissible speeds of movement under conditions of specific values of the radius of circulation are presented for the above cases. An identical solution for the magnitude of the admissible speed and the optimum radius of circulation is achieved by taking into consideration the norm of radial overloads accepted for passenger transportation. A table presented which shows the values of admissible speed of movement and optimum radius of circulation, calculated for a series of rivers of the RSFSR. The necessity is stressed for an expanded program of run tests of fast ships in order to obtain more complete and accurate information on the control and maneuverability characteristics of these ships. The absence of such information can in the final analysis lead to errors in the determination of the area where fast ships are running. Orig. art. has: 11 figures and 3 tables. TITLE: Lubrication of Nitron Fiber

PERIODICAL: Khimicheskiye volokna, 1960, No. 4, pp. 68-69

TEXT: Nitron fiber is treated with surface-active preparations in order to prevent the generation of static electricity during its processing. The newly formed, moist tow is passed through a bath containing the lubricating solution. To determine the lubricant content of the fiber, a rapid method is employed (Ref. 2), yielding, however, only 50% of the values obtained by a four hours' extraction in the Soxhlet apparatus. The authors attempted to find out the reason for this difference. For this purpose, dried Nitron fiber and freshly precipitated, moist Nitron fiber were treated with the lubricant Stearoks-6. The content of lubricant was determined by both methods and also their electrifiability was measured. The following results were obtained: When lubricating the dry fiber, the two analytical methods showed the same values for the lubricant content of the fiber. Furthermore, the electrifiability of this fiber was low. In lubricating

Card 1/2

Lubrication of Nitron Fiber

S/183/60/000/004/013/014/XX
B004/B075

the moist fiber, the lubricant penetrated into the swelled fiber. Breaking length and elongation were reduced; the electrifiability was higher than in the lubricated dry fiber, and the lubricant which penetrated into the fiber was not detected by means of the rapid method. For this reason, lubrication of the dry fiber is recommended, since in this case 50% of the lubricant can be saved. There 2 tables and 4 references: 3 Soviet.

Title : Particle Guns for High Energy Particles from a Six-Meter
Synchrocyclotron and Their Use.

Orig Pub : Atom. energiya, 1956, No 4, 13-21.

Abstract : The authors consider the problem of increasing the efficiency of the six-meter phasotron of the Institute of Nuclear Problems of the Academy of Sciences, USSR. A procedure is described for obtaining and collimating a large number of particle beams, on which several experimental setups can operate simultaneously. Brief descriptions of these beams are given.

AUTHORS: Pavlov, N. N., Chesunov, V. M.

TITLE: Relation between the evaporation kinetics of vaporization and the structure of polyamide solutions

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 10, 1962,
1547-1551

TEXT: The effect of polyamides on the evaporation kinetics of ethanol solutions was used to determine the concentration of free, active groups of polyamide (amido, carboxy, and amino groups) not saturated by cohesion. A 10% solution of AK 60/40 (AK 60/40) polyamide (60% hexamethylene diamine adipinate + 40% caprolactam) in 80% ethanol was used. The content of free, active groups was changed by adding Cr(III) salts. The solvent evaporated at 36°C (temperature of the solvent surface) and the vapor was analyzed by liquid-gas chromatography. Results: Evaporation of the solvent consisted of two parts: up to a time τ_0 which in this case was ~16 min, the alcohol: water ratio remained constant. Then, the water content of the vapor increased with $W = 1/(0.059 + b\tau)$, where

Card 1/3

S/190/62/004/010/010/010
B101/B186

Relation between the evaporation ...

$w = \%$ H₂O in vapor, τ = time, and b = coefficient. b was found to be -0.615·10⁻³ in solution I (80% ethanol without AK 60/40), -1.65·10⁻³ in solution II (1% Cr₂O₃ in the form of a CrCl₃ solution in 80% ethanol), -2.59·10⁻³ in solution III (10% AK 60/40 in 80% ethanol), and -1.73·10⁻³ in solution IV (solution II and addition of 4.5% Cr₂O₃ in the form of CrCl₃). The higher values of b in solutions II and III are explained by the formation of ethanol complexes of chromium (solution II) or AK 60/40 (solution III), whereby the volatility of ethanol is reduced. The lower value of b in solution IV is due to the binding of free, active groups of polyamide in the chromium complexes. For the content A of free, active groups, the following values are obtained: solution III $A_3 = 100 - X$; solution IV $A_4 = 100 - X - a$, where X is the content of saturated, active groups. $A_3 = -(2.59 \cdot 10^{-3} - 0.615 \cdot 10^{-3}) = \beta_3$; $A_4 = -(1.73 \cdot 10^{-3} - 0.615 \cdot 10^{-3}) = \beta_4$, where β is a linear function of A, is obtained since in solution I, $A_1 = 0$. From $A_3 : A_4 = \beta_3 : \beta_4$ it follows

Card 2/3

Relation between the evaporation ...

S/190/62/004/010/010/010
B101/B186

that X is 84.5%. Hence, AK 60/40 dissolved in 80% ethanol contains 15.5% free, active groups. There are 2 figures. The English-language reference is: A. Keller, J. Polymer Sci., 17, 291, 1955.
